Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Collagen alpha 1(II) chain precursor [imported] - horse
NyAlternate names: type II collagen
NyAlternate names: type II collagen
CyBoteles: Squares caballus (domestic horse)
CyBoteles: 31-Jan-2000 #sequence_revision 31-Jan-2000 #text_change 04-Mar-2000
CyAccession: T45467
NyAlternate to the EMBL Data Library, June 1996
A;Bescription: Cloning of equine type II collagen and modulation of its expression in eq.
A;Reference number: 222977
A;Reference number: 222977
A;Residues: preliminary; translated from GB/EMBL/DDBJ

C/Comment: The complete chain contains 1052 residues.
C/Superfamily: collagen alpha 1(1) chain; fibrillar collagen carboxyl-terminal homology;
C/Superfamily: collagen alpha 1(1) chain; fibrillar collagen carboxyl-terminal homology;
C/Keywords: coiled coil; extracellular matrix; glycoprotein; pyroglutamic acid; trimer;
F/1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental

CC -: FUNCTION: Type I collagen is a member of group I collagen

CC -: FUNCTION: Type I collagen).

CC -: SUBUNT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

CC -: SUBUNT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

CC -: TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium

Panoaller A.M., Pesciotta D.M., Eikenberry E.F., Yamamoto T.,
Pastan I., Decrembrughe B., Fietzek P.P., Olsen B.R.;
"Nucleotide sequence of a collagen cDNA-fragment coding for the carboxyl end of pro alpha 1(1)-chains.";
FEBS Lett. 11:61-65(1980).
-!- FUNCTION: Type I collagen is a member of group I collagen
(fibrillar forming collagen).
-!- SUBMIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.
-!- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                              hydroxyapatite.
-!- PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains. Pro-1153 is the only 3-hydroxypro and the only hydroxylated proline in position X.
-!- SIMILARITY: Contains 1 VWFC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 1453;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VWFC.

"Construction of DNA sequences complementary to rat alpha 1 and algorial and their use in studying the regulation of type I collagen mRNA and their use in studying the regulation of type I collagen synthesis by 1.25-dihydroxyvitamin D.";

Biochemistry 23:6210-6216(1984).

-i- FUNCTION: Type I collagen is a member of group I collagen (fibrillar forming collagen).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: Trimers of one alpha 2(1) and two alpha 1(1) chains. TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium

Bur. J. Blochem. 30:163-168(1972).

-!- FUNCTION: Type I collagen is a member of group I collagen

(fibrillar forming collagen).

-!- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

-!- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bydroxyapatite.
                                                                                                                                                                                                                                                                                                                                                                                Eukaryota, Metazoa; Chordata, Craniata, Vertebrata; Buteleostomi; Mammalia; Eutheria; Cetartiodactyla; Ruminantia; Pecora; Bovoidea; Bovidae; Bovinee; Bos.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 457
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  55
-!- PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains. Pro-726 is the only 3-hydroxypro and the only hydroxylated proline in position X.
-!- PTM: O-linked glycan consists of a Glc-Gal disaccharide bound to the oxygen atom of a post-translationally added hydroxyl group.
-!- MISCELLANEOUS: The complete chain contains 1052 residues.

"The covalent structure of collagen: amino acid sequence of the N-
terminal region of alpha2-CB3 from rat skin collagen and alpha2-CB3.

"The covaler skin collagen."

Hoppe-Seyler's Z. Physiol. Chem. 355:647-650(1974).

-- FUNCTION: Type I collagen is a member of group I collagen

(fibrillar forming collagen).

-- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

-- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PIM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

"The order of the CNBr peptides from the alpha 2 chain of collagen.";

Plochem. Biophys. Res. Commun. 38:703-708(1970).

-i. FUNCTION: Type I collagen is a member of group I collagen

(fibrillar forming collagen).

-i. SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

-i. TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               181 GSPGSPGPDGKTGPPGPAGEDGRPGPPGPPGARGEAGVMGFPGPKGAAGEPGKAGERGVP

Rossi P., de Crombrugghe B.;
Identification of a cell-specific transcriptional enhancer in the first intron of the mouse alpha 2 (type I) collagen gene.";
Proc., Natl. Acad. Sci. U.S.A. 84:5590-5594 (1987).
-!- FUNCTION: Type I collagen is a member of group I collagen (fibrillar forming collagen) 2 (I) and two alpha 1 (I) chains.
-!- SUBUNT: Trimers of one alpha 2 (I) and two alpha 1 (I) chains.
-!- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                Mus musculus (Mouse).

Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful on medical implants.

Disclosure; Fig 27A-E; 260pp; English.

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is expable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; in corporating the nucleic acid sequence into the cell; and contacting the corporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans 4-hydroxyproline and acid, selected from the group consisting of trans 4-hydroxyproline and 3-into the cell and incorporated into the extracellular matrix protein. The

ô
method may be used to make host cells assimilate and incorporate trans-4-
hydroxyproline into proteins. This is especially useful in the
recombinant production of proteins such as colladen, fibrinogen and
fibronectin whose ability to self aggregate and produce functional
proteins depends on the post translational hydroxylation of proline. The
method is also useful in studying the structure and function of
polypeptides which do not normally contain trans-4-hydroxyproline. The
present sequence represents a human collagen i (alphal) protein, which
may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                   260
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      360
